

Result Presentation & Technical Writing Style

Figures, Tables, and Expected Results Writing

Mayen Uddin Mojumdar
Assistant Professor
Computer Science & Engineering
Daffodil International University

RESULTS

Figure 1. Model performance comparison

Clear evidence
Structured display
Objective writing

Learning Outcomes

02

Understand result writing

Explain what belongs in the Results section and what should be moved to Discussion.

Use figures correctly

Select suitable graphs, diagrams, captions, scales, labels, and references.

Use tables effectively

Present numerical and categorical data with clarity and consistency.

Write expected results

Describe anticipated outcomes in proposals using careful academic language.

Avoid common errors

Reduce clutter, repetition, over-interpretation, and weak captions.

Improve technical style

Write precise, objective, reproducible, and reader-friendly results.

Goal: make results easy to verify, compare, and understand.

What Belongs in the Results Section?

04

Main findings only: data, observations, trends, measured values

Evidence from experiments, surveys, simulations, case studies, or prototypes

Figures and tables that help readers see patterns quickly

Short text that points to the most important result

Do not overload results with:

Lengthy explanation of why results happened

Unsupported claims or personal opinions

Full raw dataset when summary is enough

Method details already explained earlier

Simple rule: report what you found; explain what it means in the Discussion section.

Results	Discussion
Presents findings objectively	Interprets why findings matter
Uses values, trends, observations	Connects results with literature
Avoids speculation	Explains limitations and causes
Example: Accuracy reached 91.4%	Example: The improvement may be due to better feature selection

Useful transition: “As shown in Figure 2...” is results. “This indicates that...” usually belongs to discussion.

Figures in Technical Writing

Use visuals to simplify comparisons, trends, structures, and processes.

Designing Effective Figures

07

Choose the right type

Line chart for trends, bar chart for comparison, flowchart for process, image for visual evidence.

Label everything

Axes, units, legends, variables, model names, and sample sizes should be readable.

Write a useful caption

Caption should explain what the figure shows without forcing the reader to search the text.

Keep it clean

Remove unnecessary effects, crowded text, unclear colors, and unreadable values.

Reference in text

Every figure must be discussed in the main text before or after it appears.

Ensure consistency

Use the same fonts, units, terminology, and decimal precision across all figures.

Example: Presenting Results with a Figure

08

Figure 1. Model performance comparison

Good result writing beside the figure:

Figure 1 compares the accuracy of five models. Model D achieved the highest accuracy at 91.4%, while Model C showed the lowest accuracy at 68.2%. The results are presented using the same test dataset for all models.

Notice: the text highlights the major pattern, not every number.

Tables in Technical Writing

Use tables when exact values and structured comparison are important.

Designing Effective Tables

Rule	Why it matters
Use a clear title	Readers understand the purpose immediately
Keep columns logically ordered	Comparison becomes easier
Use consistent decimals	Prevents confusion and improves professionalism
Mention units in headings	Avoids repeated text inside cells
Avoid overcrowding	Large raw data should go to appendix or supplementary file

Table title example

Table 1. Performance comparison of machine learning models on the test dataset

Good title = what was compared + where/under what condition.

Example: Writing Results from a Table

11

Model	Accuracy (%)	F1-score	Time (s)
SVM	84.20	0.82	11.4
Random Forest	88.70	0.87	18.6
XGBoost	91.40	0.90	21.3
CNN	89.10	0.88	45.9

Sample writing:

As presented in Table 1, XGBoost obtained the best overall result with 91.40% accuracy and an F1-score of 0.90. Although CNN achieved competitive accuracy, it required the highest processing time.

Tip: mention only the values needed to support the main observation.

Writing Expected Results in a Proposal

Expected results describe what the study is likely to produce before the work is completed.

Use careful language: expected, anticipated, likely, intended, may, aims to.

Do not guarantee outcomes that depend on experiments, data quality, or implementation.

Connect expected results with objectives, methodology, and measurable outputs.

Example

The proposed system is expected to improve prediction accuracy compared with baseline models. The study is also expected to identify the most influential features and provide a reproducible evaluation framework for future research.

Avoid: “This study will definitely achieve 99% accuracy.”

Technical Writing Style for Results

Style principle	Use this	Avoid this
Objectivity	The model achieved 91.4% accuracy	Our model is very excellent
Precision	The response time decreased by 18%	The system became much faster
Consistency	Table 2 and Figure 3 show...	The table/graph somewhere shows...
Academic tone	The result indicates...	This proves everything perfectly
Reproducibility	Tested on 1,000 samples	Tested on some data

Common Mistakes and Corrections

Mistake	Correction
Writing results like discussion	Move explanation, causes, and implications to Discussion
Using figures without text reference	Mention each figure/table in the main text
Too many numbers in paragraph	Use tables for detailed values
Weak captions	Describe what, where, and condition of the result
Inconsistent decimal places	Use a fixed and meaningful precision

Result Presentation Checklist

- ✓ All figures and tables are numbered
- ✓ Captions are descriptive and complete
- ✓ Important results are highlighted in text
- ✓ Results are objective and not over-interpreted
- ✓ Each figure/table is referenced in text
- ✓ Units and axes are clearly labeled
- ✓ Formatting and terminology are consistent
- ✓ Expected results are written carefully

Task: Improve the following weak result statement

“The proposed method is very good and gives better result than others.”

Step 1

Add measurable values and comparison.

Step 2

Mention table or figure reference.

Step 3

Remove emotional or vague words.

Possible answer: “As shown in Table 2, the proposed method achieved 91.4% accuracy, which is 3.2% higher than the best baseline model.”

Strong result presentation is not just about showing data.

It is about selecting the right evidence, presenting it clearly, and writing about it with precision, consistency, and academic objectivity.

Figures show patterns. Tables show exact values. Text explains the key finding.
